## How to Size Head \& Tailstocks

## Weight Capacity

The basic Head and Tailstock configuration includes one (1) Powered rotation Headstock and a companion Non Powered Tailstock. The Headstock supports one end of the work-piece and imparts rotational motion to the work. The Tailstock merely supports the other end of the work-piece as it rotates. The first factor in selecting a HTS is to determine the maximum weight capacity required. The load should be evenly distributed between the head and tailstock; if either supports more than half of the load, (determined on CG location along the rotational centerline), an increased capacity model may be required.

## Rotation Torque Load:

To find your weldments' Rotation Torque Load, multiply the weldment weight in Pounds by the distance in inches that the Center-of-Gravity (CG) will be from the center of the table. This measurement is taken parallel to the table surface. Do not exceed the maximum load torque shown in the "rotation" column.

## Overhung Loads:

Head and tail units are rated for overhanging loads. Determine the weight and how far off of the table surface the CG (Center-of-Gravity) of the work-piece will be located, and then select the proper model Positioner.

When head and tail units are used together, the load weight is shared by both units. As explained below, if the weight is imposed on a universal joint or clamping fixture, the distance that the flexible point is off from the table face determines the overhanging load on the head and tail units.

Rigidly mounted work pieces between a head and tailstock should be avoided if possible. Misalignment, or inaccurate work pieces can create stresses that can tear the work form the table or damage the Positioners, leading to un-safe work conditions or machine failures.

# AROMSOUS series 

## Fixed Height <br> 2.5 ton to 10 ton Capacity

## Features

- Piloted tables for centering loads
- NEMA 12 Electricals
- Full length table slots
- Chassis mounted weld current grounding blocks
- Low voltage hand control pendants
- 50:1 Variable speed drives
- AC brake motors

Standard hand pendant provided with all models

[^0]

## AROLSON Series

## Fixed Height

16 ton to 120 ton Capacity

## Features

- Piloted tables for centering loads
- NEMA 12 Electricals
- Full length table slots
- Chassis mounted weld current grounding blocks
- Low voltage hand control pendants
- 50:1 Variable speed drives
- AC brake motors

Koike Aronson / Ransome manufactures Head and Tailstock Positioners with a wide range of capacities and options. These units are a strong and simple solution for the rotation of long elliptical work pieces. When used together, they require much less floor space than a Gear Driven Positioner of similar capacity.

Head and Tailstock Positioners can be used like a lathe to maintain rotation around the horizontal axis. High quality positioned welds can be performed while saving production and handling costs. Depending on the industrial application these Positioners may be mounted on fixed bases, manually adjustable bases or powered bases.

Capacities from 32,000 to 240,000 pounds between Head and Tailstock

Standard hand pendant provided with all models

Optional foot switch controls available

## ARONSON Series

## Geared Elevation 2.5 ton to 10 ton

Koike Aronson / Ransome geared elevation Head and Tailstock Positioners provide all the advantages of standard fixed height models but also include adjustable elevation to provide ergonomic working heights and improve safety.

Gear rack cut into vertical posts and multiple interlocked drive pinions provide the highest degree of safety in the industry. NEMA 12 electricals, ground blocks and tapered roller bearings are provided on every unit. Lift-time lubrication and sealed drive units insure many years of trouble free service. Special engineered elevation heights and options are also available.
Headstock and Tailstock axes on Koike Aronson Ransome systems are electronically synchronized to prevent workpiece / fixture skewing. Both axes are driven by an encoded motor, controlled by a drive with internal PLC capabilities. Encoder information from both axes is fed back to the Tailstock drive. The Tailstock encoder provides closed-loop position information to the Tailstock drive, which in turn, follows the reference signal from the Headstock encoder. The Headstock drive and motor respond to commands from the operator control pendant (or optionally a supervisory programmable control system). When the Headstock moves, the Tailstock automatically follows, step-for-step, based upon encoder feedback. If any errors are detected internally, or from external devices by either drive, the system will immediately halt to prevent workpiece/fixture skewing.

## Capacities from 5,000 to 20,000 pounds between Head and Tailstock

Features

- Multiple lift drive pinions
- 50:1 AC Variable speed rotation
- Low efficiency gear-boxes for safety
- $360^{\circ}$ continuous rotation
- Low voltage hand control pendants
- Travel cars for multiple lengths available

Standard hand pendant provided with all models

## RTNSOME Series

## Ball Screw Elevation 2.5 ton to 10 ton

The Powered Elevation design makes maximum use of commercially available components, both in the elevation and rotation systems.

Elevation is by means of commercial ball screw jacks for high duty cycle operation and driven by a worm/wormgear arrangement. The elevation axis uses two of these screw jacks for redundancy by coupling them together, and then they are driven by a common motor. Belts, chains, and transfer gears are no longer utilized in the design.

Guidance is provided by means of wide, large diameter cam follower bearings on flat guide-ways. Cam follower contact with the guide-ways is adjustable for wear. Guidance is provided on the front, back, and sides of two columns that rigidly support the cantilevered load.

Headstock and Tailstock axes on Koike Aronson Ransome systems are electronically synchronized to prevent workpiece / fixture skewing. Both axes are driven by an encoded motor which is controlled by a drive with internal PLC capabilities. Encoder information from both axes is fed to the Tailstock drive. The Tailstock encoder provides closed-loop position information to the Tailstock drive, which, in turn, follows the reference signal from the Headstock encoder. The Headstock drive and motor respond to commands from the operator control pendant (or optionally a supervisory programmable control system). When the Headstock moves, the Tailstock automatically follows, step-for-step, based upon encoder feedback. If any errors are detected internally or from external devices by either drive, the system will immediately halt to prevent

Capacities from 5,000 to 20,000 pounds between Headstock and Tailstock

## Features

- Low efficiency gear-boxes for safety
- Ball screw jacks for high duty cycles
- Machined tables
- Low voltage hand control pendants
- 50:1 AC Variable speed drives
- Boots on elevation jacks protect screws from debris

Standard hand pendant provided with all models

Optional foot switch controls available

## Specilications

## TAILSTOCK

## BANSOMES: Series

## Ball Screw Elevation 16 ton to 80 ton

Features

- Low efficiency gear-boxes for safety
- Ball screw jacks for high duty cycles
- Machined tables
- Low voltage hand control pendants
- 50:1 AC Variable speed drives
- Boots on elevation jacks protect screws from debris

Standard hand pendant provided with all models

Optional foot switch controls available

## Specifications

TAILSTOCK

## Series

## 180 Degree Tilter

## Features

- NEMA 12 Electricals
- Optional table rotation
- Powered $\pm 90^{\circ}$ tilt
- Optional geared elevation models available
- AC brake motors

In many applications, long weldments may be quickly mounted to $180^{\circ}$ Tilters instead of setting up the intricate mounting often required for head and tailstock positioners.

90 degree tilt from the horizontal position assures accessibility for down-hand or flat welding, while keeping the ends of the weldment open and accessible.
$180^{\circ}$ Tilters operate in a single range of motion and are uniquely suited for many applications. The positioners also require much less floor space than other positioning products.

Capacities from 3,000 to $\mathbf{7 5 , 0 0 0}$ pounds

Standard hand pendant provided with all models

## Specifications

## Series

## Skyhook Positioners

The Skyhook series Positioner provides 2-axis motion, continuous rotation, and $\pm 180^{\circ}$ tilt from the horizontal table position. This configuration of Positioner can also be made in a Geared Elevation version with a third powered axis for elevation. The worktable's surface can be specified at varying distances below the tilt axis, as well as specifying swing radius clearances from the table's rotation axis to the nearest obstruction.

Due to the configuration of these models, it is necessary to consult the factory for sizing and capacity requirements. The counter balancing effect of the cantilevered hanger precludes precalculated load capacity charts. Since applications require differing hanger lengths and the tables "dropped" distance below the tilt axis, the counterbalancing effect will vary greatly.

The load, center of gravity location, and swing clearance will be required to assist the factory in the selection of the correct model.

## Designed around customer loads and specifications

## Features

- AC Variable speed drives and motors
- Optional Servo Drives
- Powered $\pm \mathbf{1 8 0}{ }^{\circ}$ tilt
- Optional geared elevation models available
- Robotic versions

Hand pendant provided with standard models

## OPTIOLS

By the nature of design and function, the majority of optional equipment for Koike Aronson / Ransome Positioners should be installed at the time of manufacture. When ordering Positioners, it is therefore important to consider all optional features and equipment.

## Radio Remote Controlled Pendant

The Koike Aronson/Ransome Handheld Radio Remote Controlled Pendant is user friendly and adaptable to any Positioner. The weatherproof and lightweight pendant includes a resettable E-Stop and speed potentiometer for complete, safe machine control. A magnetic holder allows operator to keep remote out of harms way when not in use.

## Special Tables

Many standard table options are available, From round to square, machined or scribed. Standard t-slot configurations to customer specified bolt hole patterns and pilot configurations

## Variable Diameter Tachometer

Reads directly in Inches Per Minute for varying diameters, 4-Digit 5/8" LED Display. Diameter settings made on two (2) potentiometers, one having Tens scale and other having Units scale for diameters of 0 " to 260 " in $1^{\prime \prime}$ increments. Selector switch provided for IPM or RPM checking. Metal case with shielded remote cable has handles and holes for hanging.
Actual running speed sensed by precision generator.

Powered and manual cars can be used for varying length parts and moving entire vessels from bay to bay.

## Foot Switch Control

With three styles of foot switches available Koike Aronson can adapt your positioner to be used in the most efficient way.

- FSC-Foot Speed Control, provides variable speed control through the use of a foot switch.
- FPC-Provides On/Off foot control of the rotational axis.
- FWD/REV-Provides forward and reverse foot control of the rotational axis (pictured above).

Rail Cars and Bogies

## OPTIOLS

## Chucks

Self centering scroll and gripper chucks available for a large diameter range and weight capacity.

## Riser Sub-Bases

Increases the rotation centerline height for large swing diameter parts and fixtures.

## DPD, Dual Pinion Drive

Provides greater safety with a second drive pinion engaged into the final gearing. With hardened gearing and four-thread worm gearing, back-lash can be reduced for more precise applications

## Out-board supports

Weight capacity of 1000,5000 and $10,000 \mathrm{lb}$ adjustable for diameters from 2" to 48 ", with polyurethane wheels 8 " in diameter. Roller assembly is mounted on a screw adjusted stand for use as an outboard support with Positioner or Headstock. Vertical adjustment of 8 " provides infinite height settings by means of Acme screw and nut.

## Adjustable Base Models

Manually adjustable height models that available upon request.

## Universal Control

The programmable controller is designed to receive and memorize optimum work piece positions and increase productivity. The standard programmable control provides up to 3 part programs with 20 positions. The programmable Positioner system is designed to increase productivity of manual welding applications as well as aiding in the transition from manual to robotic welding applications. Built in I/O, can accept and provide "in position" signals to any robotic control. There is no need to reprogram a Positioner welding sequence; all existing programs can be utilized.
